# ANTIFOAMING AGENT & DEFOAMER

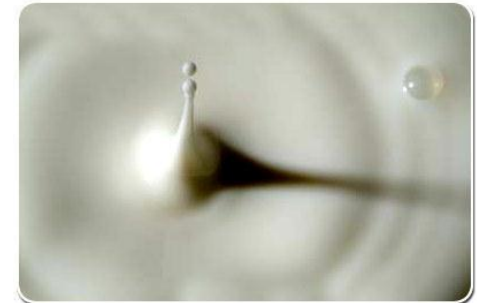

Taking on our vast manufacturing facilities, **PAT IMPEX** - Silicone Defoamers are able to offer a wide range of Silicone Defoamer and Silicone Antifoams that contain non ionic surfactants & functional additives. With the help of different surfactants, **PAT IMPEX** - Silicone Defoamers provide various types of Silicon antifoam, Antifoam Emulsion and Silicon Antifoam emulsion with foam stability. Depending upon the nature of surfactants such as nonionic, cationic, anionic or amphoteric, the liquid can be either aqueous, non-aqueous or both. The foams of these emulsions are the result of dissolved molecules in a liquid that alter the surface tension of the liquid. Formulation process of these Silicone Defoamer and Silicone Antifoams:- Agitated bubbles will form, which will immediately encounter gravitational effects pulling liquid along the bubble walls back down into the liquid beneath the bubble A simplified picture of a bubble can be described as spherical, having both an outer wall and inner wall When the surface tension is high enough, bubble formation becomes more rigid and stable If a bubble is subjected to mechanical agitation, bubbles caused by entrained air, would form very stable lamellar structures The Marangoni effect is a major stabilizing factor in foam, and is driven by osmotic pressure The aqueous liquid is being pulled through the bubbles' walls creating regions of low and high surfactant concentrations, which sets up a gradient along the bubbles' surface The gradient would pump liquid back onto the bubble walls, where this phenomenon is referred to as a surface transport The bulk viscosity also contributed to foam stability As the viscosity of liquids increase, entrained air can be trapped in bubble below the liquid's surface With the increasing viscosity of the system, the coalescence capability of smaller bubbles merging to become larger bubbles also reduces If the bubbles become large enough (increasing the diameter), bubble stability decreases

# DEFOAMER CHEMICALS

## DEFOAMER

Defoamers are the anti-foaming chemical additives that contain a blend of activated silicone oil and surfactants. This type of agents are primarily used in industrial process liquids to reduce the foam formation.

Formation of the foam can cause defects on surface coatings and prevent the efficient filling of containers. In addition to reduction in the foam generation, this type of additive also controls its complete generation in the industrial liquid.

## FEATURES OF DEFOAMER :

- Anti-foaming agents
- Contain silicone oil and surfactants
- Reduce the formation of foam
- Control the generation of foam on surface of liquid
- Used in industrial processing liquids
- Low viscosity & surface active properties
- Affinity to the air-liquid surface
